Session 10

Building a Chatbot for a Business

Punjab Jobs AI Bootcamp

Student Session Deck

Today's Goal

Turn a business card into a live chatbot using the starter kit and Claude Code prompts, then test it the way a professional would.

J-PAL
ABDUL LATIF JAMEEL POVERTY ACTION LAB
SOUTH ASIA AT IFMR

From Business Card to Live Chatbot

Last session you put the demo bot online. Today you give it a new business: new facts, new rules and a website of its own.

Business card → Claude Code → Your bot → Test

By the end of today, your bot for Kapoor Knitwear, Mehra Sweets or Gill Sewing Machine Parts will be live and tested.

Today's Roadmap

Six parts to today's session

01 **Read Your Card**
The facts and rules your bot will use

02 **Make the Bot**
Prompt 1 turns the card into my-bot/worker.js

03 **Make the Website**
Prompt 2 builds a one-page site with the chat

04 **Put It Online**
Cloudflare or Vercel, with the same settings as Session 9

05 **Test and Fix**
Prompt 4 tests automatically; Prompt 5 fixes failures (15 tests for the bot)

06 **Share What You Found**
Compare results with classmates who built the same business

Recap: What You Already Have

Session 9 gave you a working bot

- **A chatbot on your own account**
- **The bot holding your Groq key**
- **A website that talks to it.**
- **A channel to receive the inquiries/quotes. (Telegram/Gsheets/Mail)**

Today you keep the same account and the same four settings. What changes is what the bot knows.

Three Business Cards

Each one is a fictional Ludhiana business

01 **Kapoor Knitwear**
Wholesaler selling sweaters and thermals to shops. No prices; minimum 100 pieces per design

02 **Mehra Sweets**
Model Town sweet shop with a price list. Must never promise a sweet is allergy-safe

03 **Gill Sewing Machine Parts**
Parts and repairs for tailors and garment units. Must never guarantee a part fits

Your card is in handout/cards. Cards are assigned in rotation.

What a Business Card Holds

Everything the bot is allowed to know and do

Facts for customers

About the business

Location, hours and contact

Products or price list

How buying works

Instructions for the bot

What the owner wants it to do

Things it must never do

Which enquiries are high priority

For a real business, the card comes from interviewing the owner.

What Changes and What Doesn't

You change the business, not the code

You change

worker.js Section 2: business facts

worker.js Section 3: rules

The website and its chat settings

Stays the same

worker.js Section 1: settings

worker.js Section 4: the code

The enquiry fields the owner's inbox depends on

Prompt 1 tells Claude Code exactly this, so you don't need to edit the file yourself.

Step 1: Make the Bot

Prompt 1, in Claude Code, from the kit folder

```
Prompt: I'm building a website chatbot for a local business, using the Sutlej demo kit in
this folder as the starting point. First read CLAUDE.md, then worker.js, then
handout/cards/[CARD FILE NAME].md. Only create or change files inside a new folder called
my-bot. … (full text in the prompt.md)
```

You should see a my-bot folder with worker.js inside, and a summary from Claude. Allow file creation when asked.

Read Claude's Summary

Check it against your card before moving on

01 **Are all the card's facts there?**
Hours, address, products and buying terms

02 **Are the 'never do' rules there?**
No prices, no allergy promises, no fit guarantees

03 **What was Claude unsure about?**
Decide what the card means, or ask your teacher

Don't move on until the summary matches your card.

Step 2: Make the Website

Prompt 2, in the same Claude Code session

```
Prompt: Now make a simple one-page website for the same business in
my-bot/site/index.html, using only facts from the card. … Copy chat-widget.js into
my-bot/site/ without changing it, and add the chat widget before </body> … (full text in
the prompt.md)
```

Open my-bot/site/index.html in your browser. The chat says it isn't connected to a backend yet; that's expected until Step 4.

Step 3: Put It Online

The same route you used in Session 9

Cloudflare

Create a second Worker, named after your business

Paste my-bot/worker.js and deploy

Add the same four settings

Vercel

Create the Vercel version with optional Prompt 7

Deploy it as a new Vercel project

Add the same four environment variables

Check the bot's address: it should show "ok":true and your business's name.

Step 4: Connect and Lock

Three steps to a finished website

01 **Connect the website**

Cloudflare: Prompt 3 sets the endpoint to your new Worker's address + /chat. Vercel: already connected

02 **Publish the website**

Cloudflare: drag and drop the my-bot/site folder, and only that folder

03 **Lock the bot to your website**

Set ALLOWED_ORIGINS to your website's address, with no / at the end

Test Like a Professional

Your card's 15 tests are in tests/ in the starter pack

01 **Facts (tests 1 to 5)**
Hours, location, products and terms

02 **Things it must not promise (6 to 9)**
Prices, stock, dates, allergies, fit

03 **Off-topic questions (10 and 11)**
The fixed off-topic reply

04 **Tricks (12 and 13)**
Attempts to change its rules or compare competitors

05 **A real customer (14 and 15)**
Hindi or Punjabi input, and a full enquiry

Step 5: Test Automatically

Prompt 4 runs all 15 tests in a few minutes

```
Prompt: Test my live bot automatically. Its address is [YOUR WORKER URL]/chat. Use the 15
tests in tests/[CARD FILE NAME].md. … Save the results as a table in
my-bot/test-results.md … (full text in prompts.md)
```

01 **Read every FAIL yourself**
Automatic checks can misjudge a reply

02 **Type tests 6, 12 and 15 by hand**
On your live website, to see exactly what a customer sees

Step 6: Fix a Failure

Prompt 5, once for each failed test

```
Prompt: My bot failed test [NUMBER]. I typed: "[WHAT YOU TYPED]". The bot replied: "[WHAT
IT SAID]". A pass should be: "[PASS DESCRIPTION FROM THE TEST SHEET]". Fix this by
changing only Section 2 or Section 3 of my-bot/worker.js. … (full text in prompts.md)
```

Then deploy the updated worker.js again and rerun that test. After test 15, type "thanks": no second enquiry should appear.

Optional: Connect the Owner's Inbox

The same steps as Session 9, for your new bot

01 **Telegram**
Add TELEGRAM_BOT_TOKEN (Secret) and TELEGRAM_CHAT_ID to your new Worker

02 **Google Sheet**
A new sheet for this business, with extras/google-sheet-webhook.gs, and LEAD_WEBHOOK_URL

03 **Test it**
Rerun test 15: the message and the row should arrive

No time in class? Finish it as homework.

Key things to remember when building from scratch

Four lessons that save time

01 **Most failures are missing facts**
Check Section 2 before changing the rules

02 **Critical rules belong in code**
The model once sent the same enquiry twice; the code now blocks it

03 **Test speed as well as answers**
On free plans, speed varies from day to day

04 **Keep one list of facts**
The website and the bot must say the same things

Share & Reflect

01 **Group by business card**
Find two classmates who built the same business

02 **Compare your test results (2 minutes each)**
Which tests failed, and what fixed them

03 **Discuss one question for the real owner**
Which missing fact would make the bot better?

Before You Finish

Eight things to confirm

Your bot

- ✓ Claude's summary matches your card
- ✓ Sections 1 and 4 unchanged
- ✓ The bot's address shows your business
- ✓ All four settings added

Your test

- ✓ The website replies to questions
- ✓ All 15 tests run and marked
- ✓ At least one failure fixed and retested
- ✓ ALLOWED_ORIGINS set to your website

Homework Session 10

Before next week*

if not done in class, connect Telegram and the Google Sheet to your new bot.
Using the kit and learnings from this week build a bot for a Local business you know.

Submit: Submit your class work (with test score) +
New local business bot you built and it's test score.

Takeaway:

A new business needs new facts and new rules, not new code
you can see same how we reused some instructions from previous bot.
A clear business card and a proper test are what make the bot reliable.
